

**IPC-5703**

**2013 - May**

**Cleanliness Guidelines for Printed  
Board Fabricators**

*A standard developed by IPC*

*Association Connecting Electronics Industries*

---

**The Principles of Standardization**

In May 1995 the IPC's Technical Activities Executive Committee (TAEC) adopted Principles of Standardization as a guiding principle of IPC's standardization efforts.

**Standards Should:**

- Show relationship to Design for Manufacturability (DFM) and Design for the Environment (DFE)
- Minimize time to market
- Contain simple (simplified) language
- Just include spec information
- Focus on end product performance
- Include a feedback system on use and problems for future improvement

**Standards Should Not:**

- Inhibit innovation
- Increase time-to-market
- Keep people out
- Increase cycle time
- Tell you how to make something
- Contain anything that cannot be defended with data

**Notice**

IPC Standards and Publications are designed to serve the public interest through eliminating misunderstandings between manufacturers and purchasers, facilitating interchangeability and improvement of products, and assisting the purchaser in selecting and obtaining with minimum delay the proper product for his particular need. Existence of such Standards and Publications shall not in any respect preclude any member or nonmember of IPC from manufacturing or selling products not conforming to such Standards and Publication, nor shall the existence of such Standards and Publications preclude their voluntary use by those other than IPC members, whether the standard is to be used either domestically or internationally.

Recommended Standards and Publications are adopted by IPC without regard to whether their adoption may involve patents on articles, materials, or processes. By such action, IPC does not assume any liability to any patent owner, nor do they assume any obligation whatever to parties adopting the Recommended Standard or Publication. Users are also wholly responsible for protecting themselves against all claims of liabilities for patent infringement.

**IPC Position Statement on Specification Revision Change**

It is the position of IPC's Technical Activities Executive Committee that the use and implementation of IPC publications is voluntary and is part of a relationship entered into by customer and supplier. When an IPC publication is updated and a new revision is published, it is the opinion of the TAEC that the use of the new revision as part of an existing relationship is not automatic unless required by the contract. The TAEC recommends the use of the latest revision. Adopted October 6, 1998

**Why is there a charge for this document?**

Your purchase of this document contributes to the ongoing development of new and updated industry standards and publications. Standards allow manufacturers, customers, and suppliers to understand one another better. Standards allow manufacturers greater efficiencies when they can set up their processes to meet industry standards, allowing them to offer their customers lower costs.

IPC spends hundreds of thousands of dollars annually to support IPC's volunteers in the standards and publications development process. There are many rounds of drafts sent out for review and the committees spend hundreds of hours in review and development. IPC's staff attends and participates in committee activities, typesets and circulates document drafts, and follows all necessary procedures to qualify for ANSI approval.

IPC's membership dues have been kept low to allow as many companies as possible to participate. Therefore, the standards and publications revenue is necessary to complement dues revenue. The price schedule offers a 50% discount to IPC members. If your company buys IPC standards and publications, why not take advantage of this and the many other benefits of IPC membership as well? For more information on membership in IPC, please visit [www.ipc.org](http://www.ipc.org) or call 847/597-2872.

Thank you for your continued support.

## Acknowledgment

Any document involving a complex technology draws material from a vast number of sources. While the principal members of the Bare Board Cleanliness Assessment Task Group (5-32c) within the Cleaning and Coating Committee (5-30) are shown below, it is not possible to include all of those who assisted in the evolution of this standard. To each of them, the members of the IPC extend their gratitude.

<b>Cleaning and Coating Committee</b>	<b>Bare Board Cleanliness Assessment Task Group</b>	<b>Technical Liaisons of the IPC Board of Directors</b>

# Cleanliness Guidelines for Printed Board Fabricators

## 1 SCOPE

**1.1 Introduction** In many IPC standards development meetings, those individuals responsible for assessing the quality of incoming unpopulated printed boards have lamented the fact that bare printed board cleanliness is often an unknown quality parameter, often with undesired results. This is often due to the lack of understanding of materials and processes by the fabricator, or more often because the industry has driven margins so low that experienced process professionals cannot be retained by the fabricator.

Therefore, the IPC 5-32c Bare Board Cleanliness Task Group resolved to generate guidelines on those factors in the printed board fabrication process which can directly or indirectly affect the final cleanliness of packaged bare printed boards. This document is intended to be a general tutorial on items in the printed board fabrication process which can affect, directly or indirectly, cleanliness.

**1.2 Why Printed Board Cleanliness is Important** One of the aspects of printed board assembly reliability is electrochemical reliability, which is related to the residues left on an assembly. Some residues are benign while others are harmful. Electrochemical failure mechanisms are comprised of three elements: (1) an ionic residue; (2) an electrical potential or voltage gradient; and (3) moisture or humidity. All three must be present at some minimum level (which varies) for electrochemical failures to occur. Electrochemical failures are evidenced in two primary areas: (1) unacceptable leakage currents under humid conditions, and (2) electrochemical migration (dendritic growth). An example of dendritic growth can be seen in Figure 1-1.

The Venn diagram shown in Figure 1-2 is useful in understanding the relation between these three factors. The amount of impact can be visualized by considering the diameter of the individual circles to be proportional to the forcing function. As an example, if a device is operating in a very humid environment, the diameter of the humidity circle grows larger as does the electrochemical failure region. In addition, operating temperature and time can compound or accelerate these factors. Higher temperatures can increase dissolution of residues and can accelerate electrochemical reaction rates. If service lives are long, the risk of electrochemical failures increases.

Every printed board, or printed board assembly made from such boards, has a different cleanliness need. Unfortunately, not many assemblers or OEMs know how to determine how clean their assemblies have to be. There have been many instances where the present printed board cleanliness test methods, such as resistivity of solvent extract (ROSE) testing, have been inadequate to determine the true cleanliness of printed boards or assemblies.
