

Australian Standard[®]

**METHODS FOR THE ANALYSIS
OF IRON AND STEEL**

**Part 25—DETERMINATION OF
LEAD CONTENT
(FLAME ATOMIC
ABSORPTION
SPECTROMETRIC
METHOD)**

This Australian standard was prepared by Committee CH/10—Analysis of Metals under the direction of the Chemical Standards Board. It was approved on behalf of the Council of the Standards Association of Australia on 16 April 1986 and published on 7 July 1986.

The following interests are represented on Committee CH/10:

- Aluminium Development Council
- Australasian Institute of Mining and Metallurgy
- Australian Lead Development Association
- Australian Mineral Development Laboratories
- Australian Tin Information Centre
- Australian Zinc Development Association
- Bureau of Steel Manufacturers of Australia
- Confederation of Australian Industry
- Copper Technical Data Centre
- Department of Defence
- Electricity Supply Association of Australia
- Metal Trades Industry Association of Australia
- National Association of Testing Authorities
- Railways of Australia Committee
- Royal Australian Chemical Institute

Review of Australian Standards. *To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.*

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

First published (as AS K1, Part 25)	1969
AS 1050, Part 25 first published	1986

This standard was issued in draft form for comment as DR 85043.

STANDARDS AUSTRALIA

RECONFIRMATION

OF

AS 1050.25—1986

Methods for the analysis of iron and steel

Part 25: Determination of lead content (flame atomic absorption spectrometric method)

RECONFIRMATION NOTICE

Technical Committee CH-010 has reviewed the content of this publication and in accordance with Standards Australia procedures for reconfirmation, it has been determined that the publication is still valid and does not require change.

Certain documents referenced in the publication may have been amended since the original date of publication. Users are advised to ensure that they are using the latest versions of such documents as appropriate, unless advised otherwise in this Reconfirmation Notice.

Approved for reconfirmation in accordance with Standards Australia procedures for reconfirmation on 31 July 2016.

The following are represented on Technical Committee CH-010:

Australian Aluminium Council
Bureau of Steel Manufacturers of Australia
International Copper Association Australia
International Precious Metals Institute
National Association of Testing Authorities Australia

NOTES

PREFACE

This edition of this standard was prepared by the Association's Committee on the Analysis of Metals under the direction of the Chemical Standards Board as one standard in the AS 1050 series. It supersedes AS K1, Methods for the Sampling and Analysis of Iron and Steel, Part 25—1969, Determination of Lead in Low Alloy and Carbon Steels (Atomic Absorption Spectrophotometric Method).

The Committee organized an inter-laboratory test program to obtain information on the repeatability and reproducibility of the method. Laboratories from the following organizations participated in the test program to provide the data given in Table 1:

Commonwealth Steel Co. Ltd
BHP Steel International, Melbourne
BHP Steel International, Newcastle
BHP Steel International, Whyalla
BRP Steel International, Port Kembla

© Copyright — STANDARDS AUSTRALIA

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

METHODS FOR THE ANALYSIS OF IRON AND STEEL

PART 25—DETERMINATION OF LEAD CONTENT
(FLAME ATOMIC ABSORPTION SPECTROMETRIC METHOD)

1 SCOPE. This standard sets out a flame atomic absorption spectrometric method for the determination of lead in low alloy and carbon steels.

2 APPLICATION. The method is applicable to steel with lead contents in the range of 0.01 percent to 0.50 percent. It has been found satisfactory in the presence of the following elements at the concentrations indicated:

Nickel	1 percent
Chromium	2 percent
Molybdenum	1 percent
Silicon	1 percent
Manganese	2 percent
Sulphur	0.3 percent
Selenium	0.05 percent
Tellurium	0.05 percent

3 REFERENCED DOCUMENTS. The following standards are referred to in this standard:

AS 1213 Iron and Steel—Methods of Sampling

AS 2134 Chemical Analysis of Materials by Flame Atomic Absorption Spectroscopy

AS 2164 One-mark Volumetric Flasks

BS 4237 Report on Reproducibility of Methods of Chemical Analysis Used in the Iron and Steel Industry.

4 PRINCIPLE. The sample is dissolved in hydrochloric and nitric acids and the lead content of the solution is determined by flame atomic absorption spectrometry.

5 REAGENTS.

5.1 General requirements. During the analysis only reagents of recognized analytical reagent grade, and only distilled water or water of equivalent purity, shall be used.

5.2 Solids.

5.2.1 High purity iron. Iron containing > 99.5 percent Fe and < 5 µg/g Pb.

5.3 Solutions.

5.3.1 Hydrochloric acid (1 + 1). Add 500 mL of hydrochloric acid (ρ_{20} 1.18 g/mL) to 500 mL water and mix well.

5.3.2 Nitric acid (ρ_{20} 1.42 g/mL).

5.4 Standard solutions.

5.4.1 Standard lead solution (1 mL \equiv 1 mg Pb). Dissolve 1.5985 g of lead nitrate [Pb(NO₃)₂] (previously dried at 80°C for 2 h) in water. Add 10 mL of nitric acid (5.3.2) and dilute to 1 L with water.

6 APPARATUS. The following apparatus is required:

6.1 Glassware. Grade A volumetric glassware complying with AS 2164 shall be used throughout.

6.2 Atomic absorption spectrometer.

6.2.1 General. The instrument and practice shall comply with AS 2134.

6.2.2 Operating parameters. Suitable operating parameters for this test are as follows:

Wavelength 283.3 nm

Flame A slightly lean air/acetylene flame (5 cm or 10 cm slot burner).

6.2.3 Performance criteria. Prior to the test, it is necessary to establish that the following performance criteria are met:

(i) *Minimum sensitivity.* The absorbance of the calibration solution of highest lead content (see Clause 9.1) shall be not less than 0.4.
