**METHODS FOR THE ANALYSIS OF
ZIRCON SAND CONCENTRATES**

**Part 2—DETERMINATION OF
IRON CONTENT
(SPECTROPHOTO-
METRIC METHOD)**

The following industrial, scientific and governmental organizations were officially represented on the committee entrusted with the preparation of this standard:

Australian Foundry Institute
 Australian Mineral Development Laboratories
 Chamber of Mines of W.A. (Incorporated)
 CSIRO, Division of Mineral Chemistry
 CSIRO, Division of Mineralogy
 Mineral Sands Producers Association

This standard, prepared under the direction of Committee MN/4, Heavy Mineral Sands, was approved on behalf of the Council of the Standards Association of Australia on 28 July 1981, and was published on 14 September 1981.

Review of Australian Standards. *To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.*

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

PREFACE

This standard was prepared by the Association's Committee on Heavy Mineral Sands in order to provide a method for use in settling disputes arising from discrepancies between buyer and seller in the determination of iron in zircon sand concentrates.

The committee organized an inter-laboratory test program to obtain information on the repeatability and reproducibility of the method. Laboratories from the following organizations participated in the test program to provide the data given in Tables 1 and 2:

Associated Minerals Consolidated Ltd
 Australian Laboratory Services Pty Ltd
 Mineral Deposits Ltd
 Westralian Sands Ltd

This standard requires reference to the following standards:

- AS CK 19 Code of Recommended Practice for the Chemical Analysis of Materials by
 Ultraviolet Visible Spectrophotometry
- BS 3875 Optical Spectrophotometric Cells
- BS 4237 Report on Reproducibility of Methods of Chemical Analysis
 Used in the Iron and Steel Industry.

First published 1981

This standard was issued in draft form for comment as DR 80088.

© Copyright — STANDARDS AUSTRALIA

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

METHODS FOR THE ANALYSIS OF ZIRCON SAND CONCENTRATES

PART 2—DETERMINATION OF IRON CONTENT
(SPECTROPHOTOMETRIC METHOD)

1 SCOPE. This standard sets out a spectrophotometric method using the tris (1,10-phenanthroline) iron(II) complex for the determination of the iron content of zircon sand concentrates.

2 APPLICATION. The method is applicable to zircon sand concentrates containing between 0.02 percent and 0.4 percent Fe_2O_3 . Aluminium does not interfere.

3 PRINCIPLE. Decomposition of the test portion by—

- (a) fusion with sodium tetraborate 10-water/potassium carbonate mixture followed by dissolution of the melt with sulphuric acid; or
- (b) fusion with anhydrous sodium tetraborate/potassium carbonate mixture followed by dissolution of the melt with sulphuric acid; or
- (c) fusion with anhydrous sodium tetrafluoroborate followed by dissolution of the melt in sulphuric acid and fuming to remove fluorides.

NOTE: Method (a) is the preferred method of decomposition.

Reduction of the iron to iron(II) and formation of the tris(1,10-phenanthroline)iron(II) complex at a pH of 2.5 to 3.0 followed by spectrophotometric measurement of the coloured complex at a wavelength of approximately 505 nm.

4 REAGENTS.

4.1 General. During the analysis use only reagents of recognized analytical reagent grade and only distilled water or water of equivalent purity.

4.2 Solids.

- 4.2.1** Sodium tetraborate, anhydrous ($\text{Na}_2\text{B}_4\text{O}_7$).
- 4.2.2** Sodium tetraborate, 10-water ($\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$).
- 4.2.3** Potassium carbonate (K_2CO_3).
- 4.2.4** Sodium tetrafluoroborate (NaBF_4).

NOTE: Sodium tetrafluoroborate may not be readily available in analytical reagent grade. A material of suitably low impurity level may be prepared from the laboratory reagent grade by recrystallization (see Appendix A).

4.2.5 Zirconium dioxide (ZrO_2). Zirconium dioxide powder containing less than 0.001 percent iron.

4.3 Solutions.

- 4.3.1** Sulphuric acid (ρ_{20} 1840 kg/m^3).
- 4.3.2** Sulphuric acid (ρ_{20} 1840 kg/m^3), diluted 1 + 6.
- 4.3.3** Hydrochloric acid (ρ_{20} 1160 kg/m^3), diluted 1 + 1.
- 4.3.4** Ascorbic acid solution, 10 g/100 mL (freshly prepared).
- 4.3.5** Ammonia solution (ρ_{20} 880 kg/m^3), diluted 1 + 1.
- 4.3.6** 1,10-phenanthroline hydrate solution ($\text{C}_{12}\text{H}_8\text{N}_2 \cdot \text{H}_2\text{O}$), 0.5 g/100 mL. Dissolve 0.5 g of reagent in 100 mL of hydrochloric acid (1 + 99).

4.4 Standard Iron Solutions.

4.4.1 Standard solution A (1 mL \equiv 1 mg Fe_2O_3). Dissolve 0.6994 g of Specpure iron wire in 10 mL of hydrochloric acid (4.3.3). Transfer to a 1000 mL volumetric flask, dilute to volume and mix. (Solution A).

4.4.2 Standard solution B (1 mL \equiv 0.10 mg Fe_2O_3). Pipette 50 mL of solution A into a 500 mL volumetric flask. Dilute to volume and mix. (Solution B).

5 APPARATUS.

5.1 Ordinary laboratory apparatus.

5.2 Glassware. All glassware should be cleaned by soaking with chromic acid or nitric acid diluted 1 + 2, rinsing well with tap water and finally rinsing with distilled water.
