

Australian Standard[®]

**METHODS FOR THE ANALYSIS
AND TESTING OF LOWER RANK
COAL AND ITS CHARS**

**Part 6.1—ULTIMATE ANALYSIS
OF LOWER RANK
COAL—
CLASSICAL METHODS**

This Australian standard was prepared by Subcommittee MN/1/3, Brown Coal, under the supervision of Committee MN/1, Coal and Coke. It was approved on behalf of the Council of the Standards Association of Australia on 9 April 1986 and published on 7 July 1986.

The following interests are represented on Committee MN/1:

- Australasian Institute of Mining and Metallurgy
- Australian Coal Association
- Australian Coal Industry Research Laboratories Ltd
- Australian Institute of Energy
- Bureau of Steel Manufacturers of Australia
- Coal Preparation Societies of New South Wales and Queensland
- Confederation of Australian Industry
- CSIRO, Division of Fossil Fuels
- Department of Mineral Resources, N.S.W.
- Department of Mines, Qld
- Department of Resources and Energy
- Electricity Supply Association of Australia
- Institution of Engineers, Australia
- Joint Coal Board
- Queensland Coal Board
- Royal Australian Chemical Institute
- Standing Committee on Coalfield Geology, N.S.W.
- State Chemical Laboratory, Vic.
- Universities

Representatives of the following interests also participated in the drafting of this Australian standard:

- Australian Mineral Development Laboratories
- Cement Manufacturing
- Char Producers
- Coal Corporation of Victoria
- Electricity Trust of South Australia
- State Electricity Commission of Victoria

Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

First published 1986

This standard was issued in draft form for comment as DR 85045.

ISBN 0 7262 4220 9

PREFACE

This standard was prepared by the Association's Subcommittee on Brown Coal under the supervision of the Committee on Coal and Coke and the direction of the Minerals Standards Board as one in a series of standards for the analysis and testing of lower rank coals.

This standard is a companion document to AS 2434.6.2*, a rapid instrumental method using at least 100 mg coal samples.

The standard is based on AS 1038.6, Methods for the Analysis and Testing of Coal and Coke, Part 6—Ultimate Analysis of Higher Rank Coal, which has been specifically modified to meet the analytical requirements of lower rank Australian coals.

* In course of preparation.

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

FOREWORD

As a general rule, standards suitable for lower rank coals can also be applied to higher rank coals, but the reverse does not apply. Some features specific to lower rank coal methods are as follows:

- (a) *Sample mass.* Because of the greater heterogeneity of lower rank coals, relatively large sample masses are essential for successful analyses, and semi-micro methods are not applicable.
- (b) *Sample condition.* Many lower rank coals are powerful desiccants and adsorb water even in desiccators. Preparation of lower rank coal samples for analysis should involve either air equilibration followed by a moisture determination concurrent with the analysis, or complete drying and encapsulation of the sample.
- (c) *Carbon and hydrogen.* The Liebig principle is preferred for the determination of carbon and hydrogen in lower rank coals, because some high volatile coals can explode under the heating conditions of the high temperature method.

Australian Standard

METHODS FOR THE ANALYSIS AND TESTING OF LOWER RANK COAL AND ITS CHARS

PART 6.1—ULTIMATE ANALYSIS OF LOWER RANK COAL—CLASSICAL METHODS

1 SCOPE. This standard sets out the method of determining the ultimate analysis of lower rank coals and char in terms of their carbon, hydrogen, nitrogen and sulphur contents.

2 REFERENCED DOCUMENTS. The following standards are referred to in this standard:

- AS 1038 Methods for the Analysis and Testing of Coal and Coke
Part 3 —Proximate Analysis of Hard Coal
Part 8 —Chlorine in Coal and Coke
Part 16—Acceptance and Reporting of Results
Part 23—Determination of Carbonate Carbon in Higher Rank Coal
- AS 1152 Test Sieves
- AS 2165 Burettes and Bulb Burettes
- AS 2167 Straight Pipettes
- AS 2418 Glossary of Terms Relating to Solid Mineral Fuels
Part 3 —Terms Relating to Brown Coal
Part 4 —Terms Relating to Sampling, Sample Preparation, Analysis, Testing and Statistics
- AS 2434 Methods for the Analysis and Testing of Lower Rank Coal and Its Chars
Part 7 —Determination of Moisture in the Analysis Sample of Lower Rank Coal
- AS XXXX Sampling of Lower Rank Coals*
- ISO 1994 Hard Coal—Determination of Oxygen Content
- BS 1041 Code for Temperature Measurement
- BS 1752 Laboratory Sintered or Fritted Filters.

3 DEFINITIONS. For the purpose of this standard, the definitions in AS 2418.3 and AS 2418.4 apply.

4 INTRODUCTION. The ultimate analysis of coal comprises the determination of the elements carbon, hydrogen, nitrogen, sulphur and oxygen. This standard describes the determination of the total amounts of the first four elements, regardless of their mode of occurrence; oxygen is estimated by difference, because simple direct methods of sufficient accuracy are not available. Hydrogen includes that present both in the moisture and in the water of hydration of constituents of the mineral matter. All nitrogen is assumed to be present in the coal substance. Sulphur is normally present in three forms: as iron pyrites (FeS_2), as inorganic sulphates associated with the mineral matter, and as organic sulphur compounds in the coal substance.

The data obtained from use of this standard will not lead to a useful estimate of the percentage of oxygen in lower rank coal. An accurate estimate of the oxygen content can only be obtained by expressing the carbon, hydrogen, nitrogen and sulphur contents on a dry, mineral and inorganic free (dmif) basis. This in turn requires a separate determination of coal minerals and inorganic matter†. The dmif expression of results for lower rank coals is discussed in AS 1038.16.

Where the temperature for a particular operation is specified as a definite figure, it is to be understood that this figure should be attained as closely as possible and that it should be subject only to the errors inherent in accurate measurement, as defined in BS 1041.

Where a temperature range is given, the temperature may be anywhere in the range without detriment to the result. However, the mean of the range should be targeted so the inherent errors in measurement do not cause a temperature outside the specified range to be used inadvertently.

5 COAL SAMPLE.

5.1 General. The coal used for the ultimate analysis is the analysis sample ground to pass a 212 μm test sieve complying with AS 1152, taken and prepared in accordance with AS XXXX. The analysis sample may be prepared to either one of two states, air-dry or dry. If an air-dry sample is used, samples for moisture determination shall be taken and analysed concurrently with the ultimate analysis.

5.2 Preparation of air-dry coal. The sample received in the laboratory shall be brought into approximate equilibrium with the laboratory atmosphere by exposing it in a thin layer of not more than 15 mm on a tray. As many lower rank coals are prone to oxidation, the exposure time shall be kept to a minimum. The sample shall be thoroughly mixed, preferably by mechanical means, immediately before the determination.

5.3 Preparation of dry coal.

5.3.1 Sample for carbon and hydrogen. Air-dry coal shall be used to prepare the dry sample. A small platinum or silica boat with approximate dimensions of length 25 mm, width 10 mm and height 10 mm shall be used to contain the sample.

Place a clean, dry boat in a small weighing bottle and fit a lid to it (see Fig. 1). Weigh to the nearest 0.1 mg, remove the boat and fill it with 0.2 g to 0.3 g of coal. Heat the boat in a nitrogen oven at 105°C to 110°C in accordance with AS 2434.7. On removing the boat from the oven, immediately place it back in the cold weighing bottle and fit the lid. Immediately reweigh
