**STANDARDS AUSTRALIA** 

This Australian Standard was prepared by Committee EL/3, Electric Wires and Cables. It was approved on behalf of the Council of Standards Australia on 19 March 1991 and published on 13 May 1991.

The following interests are represented on Committee EL/3:

Australian Electrical and Electronic Manufacturers Association

Department of Defence

Department of Minerals and Energy, N.S.W.

Electrical Contractors Associations of Australia

Electrical regulatory authorities

Electricity Supply Association of Australia

Railways of Australia Committee

Testing interests

*Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up-to-date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.*

*Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.*

*Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.*

T  
This Standard was issued in draft form for comment as DR 90185

## PREFACE

This Standard was prepared by the Standards Australia Committee on Electric Wires and Cables and is based on requirements laid down by the Electricity Supply Association of Australia. The Standard applies to aerial bundled cables (ABC) intended for electricity supply at working voltages of 6.35/11 kV and 12.7/22 kV.

For reasons of standardization and rationalization, this Standard provides for the construction, dimensions, and test requirements of only a limited range of individually non-metallic screened three-core cables.

This Standard is complementary to the range of cables covered in AS 3599.1, *Electric cables—Aerial bundled—Polymeric insulated—Voltages 6.35/11(12) kV and 12.7/22(24) kV*, Part 1: *Metallic screened* and in AS 1429, *Polymeric insulated cables for electricity supply at working voltages 1.9/3.3 kV up to and including 19/33 kV*. Other than in respect to differing requirements for the insulation screen and the lack of a metallic screen or sheath, it is generally compatible with the appropriate requirements specified in those Standards.

### © Copyright — STANDARDS AUSTRALIA

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

## Australian Standard

### Electric cables—Aerial bundled—Polymeric insulated—Voltages 6.35/11(12) kV and 12.7/22(24) kV

#### Part 2: Non-metallic screened

**1 SCOPE** This Standard specifies the construction, dimensions and test requirements for cross-linked polyethylene (XLPE) insulated, non-metallic screened (without further protection), three phase, aerial bundled cables (ABC) incorporating a support conductor (see Figures 1 and 2), for electricity supply.

NOTE: Cable data to assist in the selection of the appropriate cables is given in Appendix C.

**2 REFERENCED DOCUMENTS** The following documents are referred to in this Standard:

**AS**

- 1018 Partial discharge measurements
- 1049 Telecommunication cables—Insulation and sheath—Polyethylene
- 1125 Conductors in insulated electric cables and flexible cords
- 1429 Polymeric insulated cables for electricity supply at working voltages 1.9/3.3 kV up to and including 19/33 kV
- 1531 Aluminium conductors for overhead power transmission purposes
- 1660 Methods of test for electric cables, cords and conductors
- 1931 High voltage testing techniques
- 2857 Timber drums for insulated electric cables and bare conductors
- C365 Drums for bare stranded conductors  
Part II—Metal drums\*

**IEC**

- 287 Calculation of the continuous current rating of cables (100% load factor)

**3 DEFINITIONS** For the purpose of this Standard, the definitions below apply:

**3.1 Phase cable**—an assembly comprising a conductor, semiconductive conductor screen, insulation and semiconductive insulation screen (see Figure 2).

**3.2 Conductor screen**—a layer or layers of non-metallic semiconductive material applied directly over the conductor.

**3.3 Insulation screen**—a layer of non-metallic semiconductive material applied directly over the insulation.

**3.4 Direction of lay**—the slope of the conductor wires or phase cable, when the phase cable or, in the case of complete cable, the cable bundle is held vertically.

It is right-hand when the slope is in the direction of the central part of the letter Z, and left-hand when the slope is in the direction of the central part of the letter S.

**3.5 Support conductor**—a conductor provided to support the three laid-up phase cables and which may act as the earth conductor.

**3.6 Length of lay**—the axial distance of one complete turn of the helix formed by a cable component, e.g. a phase cable.

**3.7 Maximum conductor temperature**—the maximum temperature at which the conductor of the cable may be operated. It is the temperature resulting from the combined effect of the ambient conditions and the current flowing in the conductor.

**3.8 Voltage designation** The rated voltages are expressed in the form  $U_o/U(U_m)$  where—

$U_o$  = the r.m.s. power frequency voltage to earth of the supply system for which the cable is designed

$U$  = the r.m.s. power frequency voltage between phases of the supply system for which the cable is designed

$U_m$  = the maximum r.m.s. power-frequency voltage between any two conductors for which cables and accessories are designed. It is the highest voltage that can be sustained under normal operating conditions at any time and at any point in a system. It excludes temporary voltage variations due to fault conditions and sudden disconnection of large loads.

\* Being revised to include covered conductors
