

Australian/New Zealand Standard™

**Guidelines on the application of
ISO 9001:2000 for the food and drink
industry**

AS/NZS ISO 15161:2003

This Joint Australian/New Zealand Standard was prepared by Joint Technical Committee QR-008, Quality Systems. It was approved on behalf of the Council of Standards Australia on 23 May 2003 and on behalf of the Council of Standards New Zealand on 8 August 2003. It was published on 29 October 2003.

The following are represented on Committee QR-008:

Airways New Zealand
Australian Chamber of Commerce and Industry
Australian Industry Group
Australian Information Industry Association
Australian Institute of Petroleum
Australian Organisation for Quality
Bureau of Steel Manufacturers of Australia
Certification Bodies (Australia)
Commonwealth Department of Transport and Regional Services
Department of Agriculture, Fisheries and Forestry (Commonwealth)
Department of Defence (Australia)
Department of Industry Science and Resources (Commonwealth)
Federal Chamber of Automotive Industries
Institute of Materials Engineering Australasia
Institution of Engineers Australia
Main Roads Department, Queensland
Master Builders Australia
Quality Society of Australasia
Royal Australian Chemical Institute
Telarc New Zealand

Additional interests participating in the preparation of this Standard:

Australian Food and Grocery Council
Australian Quarantine Inspection Services
Australian Wheat Board
Department of Agriculture, Fisheries and Forestry
Food Standards Australia New Zealand
Joint Accreditation System of Australia and New Zealand
Meat and Livestock Australia
National Meat Association Australia
Safe Food Production NSW

Keeping Standards up-to-date

Standards are living documents which reflect progress in science, technology and systems. To maintain their currency, all Standards are periodically reviewed, and new editions are published. Between editions, amendments may be issued. Standards may also be withdrawn. It is important that readers assure themselves they are using a current Standard, which should include any amendments which may have been published since the Standard was purchased.

Detailed information about joint Australian/New Zealand Standards can be found by visiting the Standards Australia web site at www.standards.com.au or Standards New Zealand web site at www.standards.co.nz and looking up the relevant Standard in the on-line catalogue.

Alternatively, both organizations publish an annual printed Catalogue with full details of all current Standards. For more frequent listings or notification of revisions, amendments and withdrawals, Standards Australia and Standards New Zealand offer a number of update options. For information about these services, users should contact their respective national Standards organization.

We also welcome suggestions for improvement in our Standards, and especially encourage readers to notify us immediately of any apparent inaccuracies or ambiguities. Please address your comments to the Chief Executive of either Standards Australia International or Standards New Zealand at the address shown on the back cover.

INTRODUCTION

ISO 9001:2000, Quality management systems — Requirements

0.1 General

The adoption of a quality management system should be a strategic decision of an organization. The design and implementation of an organization's quality management system is influenced by varying needs, particular objectives, the products provided, the processes employed and the size and structure of the organization. It is not the intent of this International Standard to imply uniformity in the structure of quality management systems or uniformity of documentation.

The quality management system requirements specified in this International Standard are complementary to requirements for products. Information marked "NOTE" is for guidance in understanding or clarifying the associated requirement.

This International Standard can be used by internal and external parties, including certification bodies, to assess the organization's ability to meet customer, regulatory and the organization's own requirements.

The quality management principles stated in ISO 9004:2000 have been taken into consideration during the development of this International Standard.

0.2 Process approach

This International Standard promotes the adoption of a process approach when developing, implementing and improving the effectiveness of a quality management system, to enhance customer satisfaction by meeting customer requirements.

For an organization to function effectively, it has to identify and manage numerous linked activities. An activity using resources, and managed in order to enable the transformation of inputs into outputs, can be considered as a process. Often the output from one process directly forms the input to the next.

The application of a system of processes within an organization, together with the identification and interactions of these processes, and their management, can be referred to as the "process approach".

An advantage of the process approach is the ongoing control that it provides over the linkage between the individual processes within the system of processes, as well as over their combination and interaction.

When used within a quality management system, such an approach emphasizes the importance of

- a) understanding and fulfilling requirements,
- b) the need to consider processes in terms of added value,
- c) obtaining results of process performance and effectiveness, and
- d) continual improvement of processes based on objective measurement.

The model of a process-based quality management system shown in Figure 1 illustrates the process linkages presented in clauses 4 to 8. This illustration shows that customers play a significant role in defining requirements as inputs. Monitoring of customer satisfaction requires the evaluation of information relating to customer perception as to whether the organization has met the customer requirements. The model shown in Figure 1 covers all the requirements of this International Standard, but does not show processes at a detailed level.

NOTE In addition, the methodology known as “Plan-Do-Check-Act” (PDCA) can be applied to all processes. PDCA can be briefly described as follows:

- Plan: establish the objectives and processes necessary to deliver results in accordance with customer requirements and the organization’s policies.
- Do: implement the processes.
- Check: monitor and measure processes and product against policies, objectives and requirements for the product and report the results.
- Act: take actions to continually improve process performance.

Figure 1 — Model of a process-based quality management system

0.3 Relationship with ISO 9004

The present editions of ISO 9001 and ISO 9004 have been developed as a consistent pair of quality management system standards which have been designed to complement each other, but can also be used independently. Although the two International Standards have different scopes, they have similar structures in order to assist their application as a consistent pair.

ISO 9001 specifies requirements for a quality management system that can be used for internal application by organizations, or for certification, or for contractual purposes. It focuses on the effectiveness of the quality management system in meeting customer requirements.

ISO 9004 gives guidance on a wider range of objectives of a quality management system than does ISO 9001, particularly for the continual improvement of an organization's overall performance and efficiency, as well as its effectiveness. ISO 9004 is recommended as a guide for organizations whose top management wishes to move beyond the requirements of ISO 9001, in pursuit of continual improvement of performance. However, it is not intended for certification or for contractual purposes.

0.4 Compatibility with other management systems

This International Standard has been aligned with ISO 14001:1996 in order to enhance the compatibility of the two standards for the benefit of the user community.

This International Standard does not include requirements specific to other management systems, such as those particular to environmental management, occupational health and safety management, financial management or risk management. However, this International Standard enables an organization to align or integrate its own quality management system with related management system requirements. It is possible for an organization to adapt its existing management system(s) in order to establish a quality management system that complies with the requirements of this International Standard.

There is a need for guidance on implementing the requirements of ISO 9001 for organizations involved in all aspects of the food and drink industry. This includes organizations involved in sourcing, processing and packaging food and drink products. This International Standard aims to encourage the use of the ISO 9000 series of standards within the food and drink industry – the use of these standards alongside other common systems in use in this sector may assist an organization to better address customer satisfaction and organizational effectiveness by the effective implementation of a quality management system.

ISO 9001 also requires organizations to seek to continually improve their quality management systems, an aspect often missing from other models of food safety management commonly used in the food and drink industry.

The adoption of a quality management system needs to be a strategic decision of the organization. The design and the implementation of an organization's quality management system is influenced by varying needs: the particular objectives, the products provided, the processes employed and the size and structure of the organization. It is not the purpose of ISO 9001 to imply uniformity in the structure of quality management systems or uniformity of the documentation. The process-oriented base of ISO 9001 makes it easier to envisage how different systems within a business link together; often it is at the interfaces between internal customers and suppliers or between different systems that problems occur. Any model which clarifies these critical areas for an organization will assist in the smooth running of its business.

ISO 9001 focuses on customers' needs and expectations. One of the most important customer expectations (and often one which is implicit rather than stated directly) is to have safe food products. ISO 9001 allows an organization to integrate its quality management system with the implementation of food safety systems such as HACCP (hazard analysis and critical control point). The internationally recognized principles and steps of HACCP are defined by the Codex Alimentarius Commission in its recommended international code of practice on general principles of food hygiene. Any other accepted food safety system can, of course, also be integrated into the quality management system. However, considering the fact that HACCP is widely used comprehensively, this system was chosen to demonstrate how integration may be achieved.

The application of HACCP within a quality management system conforming to ISO 9001 can result in a food safety system that is more effective than the application of either ISO 9001 or HACCP alone, leading to enhanced customer satisfaction and improved organizational effectiveness. As an example, the application of HACCP for the identification of hazards and control of risks is related to quality planning and preventive actions required by ISO 9001. Once the critical points have been identified, the principles of ISO 9001 can be used for control and monitoring. Procedures for conducting an HACCP study can easily be documented within the quality system.

To assist the user, the requirements of ISO 9001 are given in boxed text in this International Standard, followed by relevant guidance.

Linkages between the basic HACCP principles and specific clauses of ISO 9001 are shown in annex A.

This International Standard represents an attempt to identify the specific issues to be considered when establishing a quality management system in the field of the food and drink industry. Therefore, users of this International Standard are encouraged to gather any experience gained in connection with its application and inform the ISO/TC 34 Secretariat accordingly, so that their views can be taken into account in the first revision.

AUSTRALIAN/NEW ZEALAND STANDARD

Guidelines on the application of ISO 9001:2000 for the food and drink industry

1 Scope

This International Standard gives guidance to organizations in applying the requirements of ISO 9001 during the development and implementation of a quality management system in the food and drink industry.

This International Standard gives information on the possible interactions of the ISO 9000 series of standards and the hazard analysis and critical control point (HACCP) system for food safety requirements.

This International Standard is not intended for certification, regulatory or contractual use.

2 Normative reference

The following normative document contains provisions which, through reference in this text, constitute provisions of this International Standard. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this International Standard are encouraged to investigate the possibility of applying the most recent edition of the normative document indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

ISO 9000:2000, *Quality management systems — Fundamentals and vocabulary*

3 Terms and definitions

For the purposes of this International Standard, the terms and definitions given in ISO 9000 and the following apply.

3.1

contract

agreed requirements between a supplier and a customer, transmitted by any means

3.2

corrective action

action to eliminate the cause of a detected nonconformity or other undesirable potential situation, including any action to be taken when the results of monitoring at any critical control point indicate a loss of control

NOTE 1 There can be more than one cause for a nonconformity.

NOTE 2 Corrective action is taken to prevent recurrence whereas preventive action is taken to prevent occurrence.

NOTE 3 There is a distinction between correction and corrective action. Correction is the elimination of the nonconformity, while corrective action eliminates its cause.

NOTE 4 Definitions of “nonconformity”, “correction” and “preventive action” can be found in ISO 9000.

NOTE 5 This definition is a combination of the definitions given in ISO 9000 and reference [20].
