

Australian Standard[®]

Waters

**Part 7: The construction and use of
the Secchi disc**

This Australian Standard was prepared by Committee CH/22, Methods for Examination of Waters. It was approved on behalf of the Council of Standards Australia on 10 February 1993 and published on 17 May 1993.

The following interests are represented on Committee CH/22:

Australian Chamber of Commerce and Industry
Australian Government Analytical Laboratories
Australian Institute of Marine Science
Australian Mining Industry Council
Board of Works, Melbourne
Department of Administrative Services—Australian Construction Services
Department of Conservation and Environment
Department of Health, N.S.W.
Engineering and Water Supply Department, S.A.
Environment Protection Authority, Vic.
Government Chemical Laboratories, Qld
Griffith University
National Association of Testing Authorities, Australia
Royal Australian Chemical Institute
Rural Water Commission, Vic.
University of Melbourne
University of Sydney
Water Board, Sydney—Illawarra—Blue Mountains

Review of Australian Standards. *To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.*

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

This Standard was issued in draft form for comment as DR 92033.

RECONFIRMATION NOTICE

Technical Committee EV-008 has reviewed the content of this publication and in accordance with Standards Australia procedures for reconfirmation, it has been determined that the publication is still valid and does not require change.

Certain documents referenced in the publication may have been amended since the original date of publication. Users are advised to ensure that they are using the latest versions of such documents as appropriate, unless advised otherwise in this Reconfirmation Notice.

Approved for reconfirmation in accordance with Standards Australia procedures for reconfirmation on 15 September 2017.

The following are represented on Technical Committee EV-008:

Australasian Land and Groundwater Association
Australian Contaminated Land Consultants Association
Australian Nuclear Science & Technology Organisation
Australian Water Association
Chem Centre
Environmental Laboratory Industry Group
National Association of Testing Authorities Australia
National Measurement Institute
Sydney Water Corporation

NOTES

Australian Standard[®]

Waters

**Part 7: The construction and use of
the Secchi disc**

First published as AS 3550.7—1993

PREFACE

This Standard was prepared by the Standards Australia Committee on Methods for Examination of Waters.

Although there have been a number of scientific papers written on the design and use of the Secchi disc, there is no single paper which is regarded as definitive. Thus, workers in the field may refer to various scientific papers which have varying requirements for the design and use of the Secchi disc. Consequently results from different studies may be inconsistent.

These guidelines standardize the design and use of the Secchi disc, and therefore improve the consistency of results between various studies.

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

Part 7: The construction and use of the Secchi disc

1 SCOPE This Standard sets out general requirements and guidelines for the construction and use of the Secchi disc and a procedure for determining Secchi disc depth. The main advantages of the Secchi disc are its low cost, ease of construction, ruggedness and simplicity of use.

2 CONSTRUCTION OF SECCHI DISC The disc shall be made of any non-corrosive rigid material and be of 300 ± 10 mm diameter. To reduce the effect of currents on the angle of view, a mass of 3.0 ± 0.5 kg shall be suspended below the centre of the disc on a rigid rod 150 mm long.

The disc shall be painted with quadrants alternating in flat black and flat white waterproof paints.

The disc shall be attached to a non-stretch rope (such as a polyester cord from which the stretch, if any, has been removed) which has been marked at appropriate intervals with waterproof markings. As the waters to be measured will be of variable clarity, judgment should be made as to the scale of measurement to be used. In turbid waters, markings at 100 mm intervals would be appropriate, whereas in clear waters, markings at 500 mm intervals would be adequate. Figure 1 shows a typical Secchi disc with attached rope.

3 USE OF THE SECCHI DISC The Secchi depth value can be used as an informal visual index of depth of light penetration into a body of water, which can be used for monitoring changes in the clarity of that water body.

Owing to the clarity of the open ocean and the consequent difficulty in obtaining accurate Secchi disc measurements in this environment, the use of Secchi discs should be restricted to coastal and inland waters. It is important to realize the limitations of the Secchi disc and not attempt to gain more information from its use than is reasonable. Nevertheless, with care, it is possible to obtain useful information about various aspects of a particular water body, especially if the study is carried out over a period of at least twelve months.

Some correlation can be obtained between Secchi depth values and other parameters related to light penetration. The nature of this correlation may vary with seasonal and interannual change. This procedure is subject to a wide range of environmental influences which have a significant effect on the visibility of the disc in the water.

A number of factors will affect results and should be recorded, including the following:

- (a) The angle of the sun (readings should be taken between 2 hours after sunrise and 2 hours before sunset).
- (b) Water currents.
- (c) Weather conditions (cloud cover, wind etc).

NOTE: The visual acuity of the observer will affect the perception of the disc, thus observation of the disc should be made with corrected vision. Tinted lenses or sunglasses should not be worn, as they may affect the depth at which the disc is recognized.
