

Australian Standard[®]

**Concrete structures for retaining
liquids—Commentary
(Supplement to AS 3735—1991)**

[Title allocated by Defence Cataloguing Authority: STRUCTURES,
CONCRETE (For Retaining Liquids) NSC 56]

This Australian Standard was prepared by Committee CE/22, Concrete Structures for Retaining Liquids. It was approved on behalf of the Council of Standards Australia on 24 December 1990 and published on 4 March 1991.

The following interests are represented on Committee CE/22:

The Association of Consulting Engineers, Australia
Australian Post Tensioning Association
Board of Works, Melbourne
Brisbane City Council
Cement and Concrete Association of Australia
Confederation of Australian Industry
Engineering and Water Supply Department, S.A.
Institution of Engineers, Australia
National Precast Concrete Association, Australia
Public Works Department, N.S.W.
University of New South Wales
University of Queensland
Water Authority of Western Australia
Water Board, Sydney—Illawarra—Blue Mountains

Review of Australian Standards. To keep abreast of progress in industry, Australian Standards are subject to periodic review and are kept up to date by the issue of amendments or new editions as necessary. It is important therefore that Standards users ensure that they are in possession of the latest edition, and any amendments thereto.

Full details of all Australian Standards and related publications will be found in the Standards Australia Catalogue of Publications; this information is supplemented each month by the magazine 'The Australian Standard', which subscribing members receive, and which gives details of new publications, new editions and amendments, and of withdrawn Standards.

Suggestions for improvements to Australian Standards, addressed to the head office of Standards Australia, are welcomed. Notification of any inaccuracy or ambiguity found in an Australian Standard should be made without delay in order that the matter may be investigated and appropriate action taken.

This Standard was issued in draft form for comment as DR 89155.

PREFACE

This Supplement was prepared by the Standards Australia Committee on Concrete Structures Retaining Liquids as a commentary to provide background information and explanation on the application of AS 3735, as appropriate.

In the preparation of the Commentary, the Committee referred to the Commentary to NZS 3106–1986, *Code of practice for concrete structures for the storage of liquids* and the assistance gained from this source is acknowledged.

The paragraph numbers of this Commentary are prefixed with the letter C and refer directly to the respective Clause numbers of AS 3735, e.g. Paragraph C5.3.1 refers to Clause 5.3.1. Where there is no commentary to a clause of the Standard, the paragraph number does not appear. Figures and tables are designated C2.2, C3.1, etc., and do not correspond to those in the Standard.

References are listed as the last paragraph of the Section or Appendix in which they occur.

© Copyright — STANDARDS AUSTRALIA

Users of Standards are reminded that copyright subsists in all Standards Australia publications and software. Except where the Copyright Act allows and except where provided for below no publications or software produced by Standards Australia may be reproduced, stored in a retrieval system in any form or transmitted by any means without prior permission in writing from Standards Australia. Permission may be conditional on an appropriate royalty payment. Requests for permission and information on commercial software royalties should be directed to the head office of Standards Australia.

Standards Australia will permit up to 10 percent of the technical content pages of a Standard to be copied for use exclusively in-house by purchasers of the Standard without payment of a royalty or advice to Standards Australia.

Standards Australia will also permit the inclusion of its copyright material in computer software programs for no royalty payment provided such programs are used exclusively in-house by the creators of the programs.

Care should be taken to ensure that material used is from the current edition of the Standard and that it is updated whenever the Standard is amended or revised. The number and date of the Standard should therefore be clearly identified.

The use of material in print form or in computer software programs to be used commercially, with or without payment, or in commercial contracts is subject to the payment of a royalty. This policy may be varied by Standards Australia at any time.

Concrete structures for retaining liquids—Commentary

(Supplement to AS 3735—1991)

SECTION C1 SCOPE AND GENERAL

C1.1 SCOPE A lower concrete strength limit of 20 MPa has been imposed, as strength grades less than this are not considered suitable for structures.

An upper concrete strength limit of 50 MPa has been adopted, because much of the research on which the Standard is based involved concrete strengths at or below this value. Nevertheless, higher strength concretes are being used in Australia and overseas (Refs. C1.7.1 and C1.7.2). The Standard may be applied to such concretes, provided that the physical properties appropriate to them are used in design.

The Standard also limits the use of lightweight aggregate in structural concrete. Most Australian structural concretes employ only lightweight coarse aggregate, resulting in a concrete with a surface-dry density that is seldom less than 1800 kg/m³.

In the preparation of a Standard such as this, a certain level of knowledge and competence of the majority of users has been assumed. As indicated by the Note to Clause 1.1, it was assumed that the predominant users of this Standard would be professionally qualified civil engineers experienced in the design of concrete structures for retaining liquids, or equally qualified but less experienced persons working under their guidance. It is therefore intended that the Standard be applied and interpreted primarily by such persons.

C1.5 USE OF ALTERNATIVE MATERIALS OR METHODS The designer is usually required to seek approval from the appropriate Authority for the use of alternative materials or methods and such approval would not mean a relaxation of the requirements of the Standard, e.g. the use of fibre-impregnated concrete would not mean an automatic relaxation of the requirements for conventional reinforcement or tendons.

C1.5.3 Ferrocement Ferrocement should comply with the following:

- (a) sand/cement ratio, by volume, of not more than 3:1; and
- (b) for galvanized and epoxy-coated steel reinforcement, the minimum cover given in Table 4.3 may be reduced by 15 mm provided no negative tolerance is permitted and the surface is hand trowelled.

C1.6 DRAWINGS AND SPECIFICATIONS The information applicable to most concrete members may be shown on only one of the drawings, usually the first sheet.
