

AS/NZS ISO 16175.1:2021
ISO 16175-1:2020

Australian/New Zealand Standard™

Information and documentation — Processes and functional requirements for software for managing records

Part 1: Functional requirements and associated guidance for any applications that manage digital records

AS/NZS ISO 16175.1:2021

This Joint Australian/New Zealand Standard™ was prepared by Joint Technical Committee IT-021, Records and Document Management Systems. It was approved on behalf of the Council of Standards Australia on 09 March 2021 and by the New Zealand Standards Approval Board on 03 March 2021.

This Standard was published on 19 March 2021.

The following are represented on Committee IT-021:

- Archives and Records Association of New Zealand
- Archives New Zealand
- Association of Local Government Information Management
- Australian Computer Society
- Australian Industry Group
- Australian Society of Archivists
- Department of Defence (Australian Government)
- Department of Education, Tas
- Monash University
- National Archives of Australia
- Office of Finance & Services, NSW
- Public Record Office Victoria
- Queensland State Archives
- Records and Information Management Professionals Australasia
- Records and Information Management Professionals Australasia— New Zealand
- State Archives and Records Authority of New South Wales
- State Records of South Australia
- State Records Office of Western Australia
- University of Sydney
- Transpower New Zealand

This Standard was issued in draft form for comment as DR AS/NZS ISO 16175.1:2020.

Preface

This Standard was prepared by the Joint Standards Australia/Standards New Zealand Committee IT-021, Records and Document Management Systems, to supersede AS/NZS ISO 16175.1:2012, *Information and documentation - Principles and functional requirements for records in electronic office environments, Part 1: Overview and statement of principles*.

The objective of this document is to provide model, high-level functional requirements and associated guidance for software applications that are intended to manage digital records (including digital copies of analogue source records), either as the main purpose of the application or as a part of an application that is primarily intended to enable other business functions and processes.

This document does not include:

- (a) functional requirements for applications that manage analogue records;
- (b) generic design requirements such as reporting, application administration and performance;
- (c) requirements for the long-term preservation of digital records in a dedicated preservation environment;

NOTE The model requirements are intended to encourage the deployment of applications that do not hinder long-term preservation of records. As such, some of the requirements support long term digital preservation outcomes.

- (d) implementation guidance for applications that manages analogue and/or digital records.

This Standard is identical with, and has been reproduced from, ISO 16175-1:2020, *Information and documentation — Processes and functional requirements for software for managing records — Part 1: Functional requirements and associated guidance for any applications that manage digital records*.

As this document has been reproduced from an International Standard, a full point substitutes for a comma when referring to a decimal marker.

Australian or Australian/New Zealand Standards that are identical adoptions of international normative references may be used interchangeably. Refer to the online catalogue for information on specific Standards.

The terms “normative” and “informative” are used in Standards to define the application of the appendices or annexes to which they apply. A “normative” appendix or annex is an integral part of a Standard, whereas an “informative” appendix or annex is only for information and guidance.

Contents

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 46, *Information and documentation* Subcommittee SC 11, *Archives/records management*.

This second edition cancels and replaces the first edition (ISO 16175-1:2010), which has been technically revised. The main changes compared to the previous edition are as follows.

- The distinction between dedicated records management applications and business applications has been dispensed with. As a result, a single set of functional requirements and associated guidance is provided in a single document that addresses both kinds of software applications.
- The number of functional requirements has been greatly reduced and simplified in order to help users focus on the most important areas of software functionality.
- Text has been updated, clarified and simplified, with the use of records jargon eliminated where possible and explained when necessary in acknowledgement of the primary audience for the standard being IT professionals. More diagrams have been added.

A list of all parts in the ISO 16175 series can be found on the ISO website.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

0.1 Case for management of records

Good management of records and information is fundamental to a well-functioning organization. It supports business functions and processes and provides a basis for efficient service delivery. It also provides the mechanism for organizations to retain evidence of their decisions and actions for future reference and to support business continuity. Good records practice is simply good business practice.

Managing records facilitates:

- a) efficiency, by making information readily available when needed for decision-making and operational purposes and to support information reuse and innovation;
- b) sound use of financial resources, by allowing timely disposition of non-current records;
- c) accountability, by enabling the creation of complete and authoritative records of business functions and processes;
- d) compliance, by demonstrating that legal requirements have been met; and
- e) risk mitigation, by managing the risks associated with unlawful loss or destruction of records and with over-retention of records, and risks resulting from inappropriate or unauthorized access to records.

In most organizations today, business is transacted and enabled by a variety of software applications. If organizations are to capture and manage reliable records of their business functions and processes, it is vital that their line-of-business applications incorporate good records functionality as part of their design. Making, keeping and disposing of records should be an organic and natural part of business processes.

0.2 Purpose of this document

This document provides model, high-level functional requirements, with associated explanatory information and usage guidance, for any software applications that are intended to manage digital records. ISO/TS 16175-2:^{—1)} provides guidance on how to select/design, implement and maintain software for managing records within organizations.

For the purpose of presenting model functional requirements, this document makes no distinction between software applications that are used for any business purpose and those applications specifically intended and designed to manage records. Examples of the former include Enterprise Content Management Systems and applications which create records as one part of their functionality such as Contracts Management Systems, Case Management Systems or transactional systems. The term used throughout is therefore “Business application”, which is intended to encapsulate the totality of applications that manage records as part of their usual functioning. It is assumed that almost all business applications will generate data that is needed to serve as evidence of business functions and processes for future reference and as such will, among other things, need to create, store and manage records. The purpose of this document is to assist the developers and implementers of those applications to identify and deploy functional requirements that helps ensure that the data generated and held in such applications can serve as adequate records of business functions and processes.

In addition to providing model high-level functional records requirements in business applications, this document provides guidance on identifying and addressing the needs for records. It aims to:

- a) help organizations understand requirements for managing digital records as they relate to software applications used by organizations;
- b) assist IT and business specialists to include records considerations in applications design and/or procurement; and

1) Under development. Stage at the time of publication: ISO/DTS 16175-2:2020.

- c) assess the capabilities of existing business applications to manage records, including helping to identify gaps or areas of risk in the current functionality of those applications.

This document is part of a suite of records system implementation guidance that supports the core international records management standard, ISO 15489-1, where utility and characteristics of records systems are explained.

0.3 Audience

The primary audience for this document are professionals responsible for designing, developing, procuring, reviewing and/or implementing software applications, such as business analysts, applications developers, solution architects and IT procurement decision-makers. The audience also includes records professionals who are involved in advising or assisting in such processes.

Role	Purpose
Solution architects/designers	Ensure IT applications infrastructure supports the records requirements.
Records professionals	Advising and assisting the business in defining records requirements.
IT procurement decision-makers	Ensure procurement processes meet these requirements.
Applications developers	Build applications and support information systems testers during functional specification development and test phase. Includes software vendors and developers who wish to incorporate records functionality within their products, both commercial or open source.
Business analysts	Develop technical specifications; initiate/collate feedback and walkthrough. Submit specification for sign-off and pass over to developer. Update any changes to specification after sign-off (e.g. changes that are agreed during test phase), if required.
Applications testers	Develop test plans, test conditions/cases and execute tests. Analyse test results, log any failures and retest once immutability has been applied and built to test environment.
Business owners	For solution-specific requirements. Review and confirm application requirements that meet business objectives. Provide the business rules/processes/requirements to the business analyst during the software specification development and test phases.

Given the target audience for this document, the use of terminology that is specific to records professionals has been minimised as far as possible. Where the use of such terminology is unavoidable, it is explained and/or defined (in [Clause 3](#)).

NOTES

Australian/New Zealand Standard

Information and documentation — Processes and functional requirements for software for managing records

Part 1: Functional requirements and associated guidance for any applications that manage digital records

1 Scope

This document provides model, high-level functional requirements and associated guidance for software applications that are intended to manage digital records (including digital copies of analogue source records), either as the main purpose of the application or as a part of an application that is primarily intended to enable other business functions and processes.

It does not include:

- functional requirements for applications that manage analogue records;
- generic design requirements such as reporting, application administration and performance;
- requirements for the long-term preservation of digital records in a dedicated preservation environment;

NOTE The model requirements are intended to encourage the deployment of applications that do not hinder long-term preservation of records. As such, some of the requirements support long-term digital preservation outcomes.

- implementation guidance for applications that manages analogue and/or digital records. Such guidance can be found in ISO/TS 16175-2:—²⁾.

2 Normative references

The following document is referred to in the text in such a way that some or all of its content constitutes requirements of this document. For undated references, the latest edition of the referenced document (including any amendments) applies.
